MAb capable of binding to the gamma chain of the IL-2 recept thus of blocking the IL-2 response, is produced by mouse hyb line GP-2 (FERM BP-641). DNA encoding the variable region this MAb was expressed in E. coli, yielding Fv(GP-2) with immumosuppressive activity.

Example; Fig 8; 37pp; English.

The source of human erbB-2 protein for the prodn. of antibodies not and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
PT labels or cytotoxin, useful for detection and treatment of tumour procedules expressing this protein

Example 9; Columns 27-30; 28pp; English.

Character of the present cDNA sequence codes for a claimed single-chain antibody, designated e21(FY), which binds to erbB-2. Monocional antibody e21

Character of the present cDNA sequence codes for a claimed single-chain antibody e21

Character of the present cDNA sequence codes for a claimed single-chain antibody e21

Character of the processing mice with N/erbB-2 cells overexpressing the pp185 protein, removing spleen cells and producing hybridomas composition to the anti-erbB-2

Character of the present expressing for the anti-erbB-2

Character of the heavy- and light-chain variable regions were then coding for the heavy- and light-chain antibody is useful for in vitro linker. The resulting single-chain antibody is useful for in vitro clisher. Each overian and non-small cell lung carcinomas, comparison of the coding a peptide coding single-chain antibody is useful for in vitro clisher. Each coding carcinomas, comparison of the coding and constant cells which overexpress the erbB-2 gp185

CC marker, e.g. breast, overian and non-small cell lung carcinomas, coding and comparison of the coding and carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           24-DEC-1996.

Expression vector encoding bispecific fusion protein - having binding domains for separate targets joined by helical peptide, and treatment useful e.g. for diagnosis and treatment is Example 1; Fig 11; 50pp; English.

The VL and VH sequences of the anti-CD3 hybridoma G19-4 were amplified by PCR methods. A gene fusion was constructed from the Ct two amplified domains and a (G1945er)3 linker. The amino the Light chain variable region leader peptide and the carboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the Ccarboxyterminus was fused directly to the hinge region of the FC domain at the Bc11 site and/or to a short "helical" peptide linker to construct the bispecific CD3-L6FvIg antibody derivative. The Ccarboxyterminus constructed in G81076).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
                                                                                                     Complete containing a target binding molety capable of binding to a serpin enzyme complex receptor (SECR), and a nucleic acid binding to a complex receptor (SECR), and a nucleic acid binding molety. This can be used in a method for delivering an oligonucleotide to a companian cell. The method comprises conjugating the target binding to a context to form a pharmaceutical composition. A mammalian cell having on its confidence SECR, is contacted with the pharmaceutical composition. A mammalian cell having on its conditions allowing binding to the receptor resulting in delivery of the pharmaceutical composition to the interior of the cell. The composition and method are used for the introduction of exogenous genetic material into target host cells expressing SECR on their surface. The nucleic acid may encode a functional wild-type or mutant gene or may be an antisense composition may comprise a protein partion having therapeutic properties, ce.g. enzymatic activity, cytokine activity and antibiotic activity which is delivered to a cell surface via the SECR binding molety. The nucleic acid can be compacted at high concentrations with the carrier molecule at a critical salt concentration. The condensation of such complexes convoices of the concentration of such complexes and concentration of such complexes are convoices of the concentration. The condensation of such complexes are convoices of the concentration of such complexes are convoices of the concentration of such complexes are convoices of the concentration. The condensation of such complexes are convoices of the concentration of such complexes are convoices of the concentration.

MAb capable of binding to the gamma chain of the IL-2 receptor, and thus of blocking the IL-2 response, is produced by mouse hybridoma line GP-4 (FERM BP-4640). DNA encoding the variable region of this MAb was expressed in E. coli, yielding FV(GP-4) with immumosuppressive activity.

Expression-secretion vectors - for prodn. of biologically active antibody Fv fragments or single chain Fv molecules

Sisclosure; F19 6; 51pp; English.

This sequence encodes a single chain Fv molecule which contains the heavy and light variable portions (VH and VL) of antidigitoxin monoclonal antibody (MAD) 26-10, a signal sequence and a linker between the two variable regions. This sequence was used in the construction of an expression-secretion system for the production of biologically active Fv fragments. The system also contains a DNA sequence encoding the T7 promoter. The secretion expression vector was produced by polymerase chain reaction (see also Q41070-81). Fv fragments comprising only the VH or VL regions, and single chain concleules may be used to specifically bind one or more of the same antigens as the full length antibody from which they are derived.

                                                                                                                                                                                                                                                                                                     Disclosure; Fig 3; 26pp; English.

The sequence is an Ndel-HindIII fragment encoding the L and H chains of murine MAD OVB3, joined together via a linker. The sequence is present in clone povB3158-1 in which the 3' end is linked to the 5' end of the coding sequence for PB40, a a Pseudomonas exotoxin lacking domain I. The protein expressed by the clone can be used to kill specific target cells.

New antigen binding proteins contg. immunoeffector or cytolytic peptide - attached to variable regions of antibody light or heavy chain, useful in diagnosis and in destroying cancer cells Example 1; Fig 4A-B; 72pp; English.

A novel DNA construct (T29058) codes for a single-chain antigen-binding fusion protein (R97380) comprising the light chain variable region (VL) of monoclonal antibody CC49 linked to the CC49 VH region via a spacer peptide (R97379), with a C-terminal phospholipase A activating protein (PLAP) immunoeffector peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic.

It was obtd. by ligating a synthetic PLAP frexisting CC49/212 gene, and can be used to produce the protein in transformed host cells. The fusion protein the tumour antigen-binding capability of CC49 with the immunoeffector function of PLAP.

A novel DNA construct (T29059) codes for a single-chain antigen binding fusion protein (R97381) comprising the light chain variable region (VL) of monoclonal antibody CC49 linked to the CC49 VH region via a spacer peptide (R97379) and with an N-terminal phospholipase A activating protein (PLAP) immunoeffector peptide (R97368). It can be used to produce the fusion protein in transformed host cells. The fusion protein combines the tumour antigen-binding capability of CC49 with the immunoeffector function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PLAP CC49/212 SCA DNA construct.
